ROUTINES & HABITS

1.Website specifications

Routines and Habits is a website designed to provide guidance and insight to students who have problems with time management, study habits and maintaining productive routines. These disciplines are often essential to practice to make good progress and succeed in academia.

The website presents different strategies and techniques that students can apply to improve areas where they may be struggling. It also provides links to additional resources in case the methods presented do not work for every individual circumstance.

The website is created from the perspective and experience of a tertiary student who has personally faced similar challenges. Through researching different study methods and time management strategies on the internet, the aim of the website is to share practical advice and helpful information with other students who may be facing the same difficulties and encourage better academic self discipline.

The website will be built using HTML for structure, CSS for look and styling, and may include JavaScript for interactive features. After development, the website will be uploaded to GitHub and published using GitHub Pages so that it can be accessed online.

2. Website Goals and Objectives

The main goal of the website is to help students develop better academic habits and improve their ability to manage their time effectively.

The objectives of the website include:

- Providing information about daily routines that can improve academic success
- Explaining effective study techniques
- Offering practical time management strategies
- Helping students understand how consistent habits improve productivity
- Allowing users to share feedback or suggestions through a feedback form to further improve and add to the website.

By following these objectives, the website aims to help students in becoming more organised, focused, and productive in their academics and hopefully their general lives.

3. Target Audience

The main target audience for this website is students in general but mainly catered to those studying at colleges and universities. Many students struggle with properly managing lectures, assignments, studying, and personal responsibilities, which can make it difficult to maintain consistent routines.

The website is mainly for students around the ages of 16 and 25, although the information may also benefit other learners who want to improve their productivity and study habits.

The content will be written in simply and clearly so that it is easy to understand. The layout of the website will also be designed to make navigation simple, allowing users to quickly find the information they need.

4. Information Design / Site Structure

The website will consist of several pages, each focusing on a specific aspect of student productivity and organisation.

The main pages of the website include:

Home Page (index.html)
The homepage introduces the purpose of the website and explains why routines and good habits are important for academic success.

Daily Routines Page (routines.html)
This page provides examples of productive daily routines that students can follow to stay organised and consistent with their work.

Study Habits Page (study.html)
This page discusses useful study techniques, including methods for improving concentration, remembering information, and preparing for exams.

Time Management Page (time.html)
This page explains strategies that students can use to manage their time better, such as planning study schedules and prioritising tasks of urgent/certain importance.

About Page (about.html)
This page provides background information about the website and its purpose.

Feedback Page (feedback.html)
This page contains a form that allows users to give feedback, suggestions, or comments about the website. All pages will be connected through a navigation menu so that users can easily move between sections.

5. Navigation Structure

The website will use a consistent navigation bar that appears on every page. This will allow users to easily access different sections of the website.

Example navigation structure:

Home | Daily Routines | Study Habits | Time Management | Feedback | About

This structure ensures that users can quickly move between pages without needing to return to the homepage each time.

6. Technical Brief

The website will be developed using modern web development and styling technologies to ensure that it is functional and easy to maintain.

HTML5 will be used to structure the content of the website, including headings, paragraphs, images, navigation menus, and forms.

CSS3 will be used to style the website and improve its visual appearance. This will include colours, fonts, spacing, and page layout.

JavaScript and Bootstrap may be added later to introduce interactive elements such as productivity tools or dynamic features.

The website will be developed using a code editor such as Visual Studio Code. All files will be stored in a repository on GitHub and linked to a local folder on my personal computer, and the completed website will be published online using GitHub Pages.

7. Design Considerations

The design of the website will focus on simplicity, readability, and ease of navigation so that the user can deal directly with the content they came for with minimal distraction.

A clean layout will be used so that users can easily read the information on each page. Colours will be chosen to create a calm and focused environment that oozes the theme of productivity and organisation.

Headings and sections will be clearly structured so that users can identify important information. Images and visual elements like video media may also be included to make the content more engaging and easier to understand.

The website will be responsive so that it can be viewed on different devices such as desktop computers, laptops, tablets, and mobile phones.

8. Future Improvements

Although the first version of the website will mainly provide informational content, additional features could be added in the future to make the website more interactive and useful for students.

Possible future improvements include:

- A productivity tracker that allows students to track daily habits
- An Eisenhower Matrix tool to help prioritise tasks
- A timetable generator that helps students organise study schedules
- Additional JavaScript features that provide interactive productivity tools
- Updates and additions to content to cater to different types of students like high school students and not just college and university students

The academic aspect of a student's life can also be influenced by different mental health problems like stress, anxiety, depression, imposter syndrome and etc, or learning disabilities like dyslexia, dyscalculia etc that are negative factors that hinder productivity and make self improvement even with the methods provided hard. In future I hope to add features and content to the website that help find or links to resources like blogs articles or videos can provide that help.

If I find it feasible in the future, I want to add a feature where users can interact with each other and study or ask questions pertaining to certain questions to cater to users who have trouble solution but could benefit from a positive group/community learning environment.

These improvements and additions would make the website more engaging and provide practical tools that students can use to manage their academic responsibilities more effectively. Although some of the more major future additions I hope to add require extensive research and consultation, they are improvements to look forward to as I intend for them to be of actual use to students who have been where i am and where i will be or further academically.

8.Quality Assurance

The following images are test samples of the home page of my website on different browsers on Mobile and on a laptop.
